Quality Assurance Engineer

Requisition ID	10815
Location	Burbank, CA
Description	The Internet is a big, busy place, and we at Yahoo! are proud to stand out in the crowd. As the world's number one Internet brand, servicing over a half billion people, we're determined to maintain our commitment to delivering news, entertainment, information and fun… each and every day.

In order to maintain our position as one of the world's most trafficked Internet destinations, we're always on the lookout for people with big ideas and big talent to help us provide our visitors with the innovative products and services they've come to expect from Yahoo! We're looking for people like you.

How Big Can You Think?

Title: QA Engineer
Job ID: 10815
Location: Burbank, CA

Description:

Yahoo's Search Advertising and Technology Group (SATG) is recruiting for an exciting, priority project called Apex / Keystone. You will contribute to the design and implementation of test plans, test cases and validation, by creating and using test tools of complex, multi-tier software. You will also interface with other QA engineers, developers, product managers and operations teams to complete projects. You should possess skills in testing and implementing tests on components written in C++/Perl as well as testing API-based web applications. The ideal candidate should have a proven history and dedication to SQA processes, particularly Agile / Scrum testing and implementation.

Responsibilities:

* Act in a lead capacity with projects and people
* Fully understand internal and external software processes
* Design test plans, review functional requirement documentation and present test cases for project team review
* Implement test cases after acceptance or work with QA developer(s) to implement.
* Submit, regress, and verify defects
* Conduct white box and grey box testing
* Work with development engineers to create home-grown scripts to facilitate ad-hoc

This job description is a fairly typical QA position. This position will only be exempt if it meets the salary requirements. For 2008, this means that you need to make more than $112,320 if you work a 60 hour week.

testing as well as provide valuable input on creating more sophisticated, cross-platform QA tools which will assist the manual test process
* Be proactive and exercise flexibility and multi-tasking ability in a high stress environment
* Work within a dynamic, fast-paced environment

Minimum Qualifications:

* 2+ years in a team lead a capacity
* 2-4 years of recent Unix/Linux experience
* 5-7 years experience in testing requirements and test plan design for applications in UNIX/LINUX/FreeBSD environments.
* Strong UNIX/LINUX command-line troubleshooting background
* Ability to implement C / C++ test cases
* Scripting (C++, PERL, PHP, Shell) knowledge
* Backend testing experience
* Working experience with Apache/Tomcat web servers
* Proficiency in test planning and test case writing
* Experience with load testing theories, methodologies, analysis and tools
* Basic SQL knowledge
* Basic shell scripting knowledge
* Familiarity with basic XML principles
* Strong written and verbal skills are required.

Preferred Skills:

* BS/BA in Computer Science or equivalent experience in a related field
* Working knowledge of at least one suite of automation tools (i.e., Segue, Rational, Mercury, Empirix, etc.)
* Multi-tier, multi-server testing experience
